Conclusion: Empowerment through Knowledge ...................... 31
Foreword

The world today is a far cry from the world of the 1970s when the International Development Research Centre (IDRC) was first founded. The context in which global development finds itself today — principally as a result of changes compressed in the last decade — is light years away from that which was known to the architects of our post-World War II order. Recognizing the need for change and renewed relevance, IDRC has recently been involved in a process of reflection and debate as to how we can contribute most effectively to development in the coming decade.

Our Board of Governors, an independent body comprising leading scientists and development specialists from all parts of the world, continues to be part of the uniqueness of IDRC. The Board provides an exceptional calibre of knowledge and experience, much of it from a perspective of the countries of the South.

In recent years, much of the Board’s attention has been devoted to IDRC’s future strategy. In June of 1991, the Board’s Executive Committee asked IDRC President Keith Bezanson to develop a new strategic approach for the Centre. The resulting document was presented in October 1991 and met with the Board’s full support. Then in June 1992, the Prime Minister of Canada announced at the United Nations Conference on Environment and Development in Rio that IDRC was to be given the special responsibility of working with developing countries on the implementation of Agenda 21.

The broad principles of the IDRC strategy remain unchanged; however, there is now in place a program framework that lays out
the specific program areas on which IDRC will be focusing during 1993-1996, in direct response to the task given to it at UNCED. This Corporate Program Framework is available as a separate document.

The strategy presented here includes an assessment of the emerging context for development, the advantage that the Centre brings to that context, some principles and practices that will guide our actions and choices over the next several years, and a description of the Centre’s new structure. The strategy provides the foundation for more specific program plans, based as it is on the unwavering commitment to “empowerment through knowledge” for the developing nations of the world.

Flora MacDonald
Chairperson of the Board of Governors
Our Mission

The Act of Parliament creating IDRC assigns the Centre a unique role among Canadian institutions and a distinctive place among international development agencies. IDRC’s mission can be stated succinctly thus:

*Empowerment through Knowledge*

These three powerful words express the relationship between knowledge and development and the conviction that empowerment through knowledge is the key element in the development of nations, peoples, communities, and individuals. Research provides the means for the acquisition of appropriate knowledge and, by extension, for development. The capacity to conduct research, therefore, is a necessary condition for empowerment. IDRC is dedicated to creating, maintaining, and enhancing research capacity in developing regions, in response to needs that are determined by the people of those regions in the interest of equity and social justice.

The task before us is to translate the Centre’s mission into a clear program framework that will guide and inform the detailed decisions to be made in consultation with our research partners, and that will permit an assessment of our progress. To do so requires

- a new perspective on development and IDRC’s place in it;
- a sharper program focus;
- a restructuring of our programs to maximize the impact of available resources;
- greater efficiency in program execution and administration;
- perseverance in our efforts; and
- flexibility and agility in changing circumstances.

In the coming decade, IDRC will strive to consolidate and reinforce a vision of itself as a results-oriented, “research-for-development” organization. This implies developing and sharing with others a conception of IDRC that emphasizes the potential benefits of the research it supports, that links developing countries
with global research agendas and potential beneficiaries with local problem-solving efforts, and that is capable of influencing others as a result of the quality and innovative character of its work.

**World in Transition**

Over its 20-year history, IDRC has made significant contributions to the work of international development. To maintain the Centre’s relevance and effectiveness, we must anticipate and adjust to major transformations on the international scene. The global order in 1993 is markedly different from that prevailing in 1970 when the Centre was founded. The political, economic, social, cultural, environmental, scientific, and technological changes of the past two decades have created an entirely new context for developing countries and for IDRC. This section reviews briefly some of those changes and examines their implications for the development community in general and IDRC in particular. Major recent changes include the following:

- **Dissolution of the East-West Balance of Power**

  The political environment is changing at a rapid rate. The predominant feature of the post-war period — the East-West balance of power — has been radically transformed. The world is still coming to terms with a new international order in which East-West tensions are a much less powerful influence. The role of the nation state has also been transformed. Our political systems and our thinking about the management of economic, environmental, and social forces are based on the concept of the nation state, but supranational and transnational entities increasingly erode the ability of the state to control such phenomena. Also, totalitarianism is in retreat in many parts of the world as democratic movements and political pluralism spread and take hold. In other regions, internecine conflicts hold citizens in the grip of terror and deprivation, and threaten world peace.
• Population Growth

The explosive growth in social demands in developing regions has been largely triggered by population increases during the past 50 years. These are extensively catalogued in the 1990 World Development Report of the World Bank, which focuses on poverty, and in the 1991 Human Development Report of the United Nations Development Programme (UNDP). Food and nutrition demands have multiplied many times over, particularly in the poorest countries. Even though the world's farmers produce more than enough to provide adequate nourishment for all, existing political, social, and institutional arrangements — at both the national and international levels — have proved incapable of relieving the horror of famine in the developing world. The situation regarding basic health care and education is similarly skewed.

Eager for a better life, people flock in great numbers to the cities where rapid urbanization has created huge demands for housing, sanitation, transportation, and energy supply. The cities, however, cannot cope with the demands of a burgeoning population, and have become sprawling centres of poverty and desperation. Overpopulation also leads to unemployment and underemployment, which have emerged as two of the most troublesome and dangerous phenomena in developing countries.

The world has finally come to realize that the global ecosystem has finite limits and will not be able to withstand indefinitely the various pressures of unchecked population growth and uncontrolled development. Thus, environmental sustainability has become the most stark aspect of planetary interdependence, applying with equal force to all countries, irrespective of wealth, geographical position, or political system. Lifestyles, resource use, and production systems will have to change in all countries if sustainable development is to be achieved.
• **Trade or Development?**

The rapid growth and globalization of financial markets began in the mid-1970s. Financial markets now form a complicated set of many kinds of transactions, which have become increasingly independent of the production and distribution of goods and services. Although these changes may conceivably present new opportunities to some developing countries, they also pose new obstacles, the removal of which will require major policy adjustments, highly trained professionals, and agile managers.

International trade will never be the same again. The North Pacific has taken the lead over the North Atlantic as the world's largest trading area. The content of international trade has shifted away from commodities (exported primarily by developing countries) toward high-technology services and manufactured products (typically the exports of industrialized nations). Powerful new regional trading blocs are fast emerging that will have major economic effects on both developing and industrialized nations.

• **Aid to the Poorest Nations**

Concerning the international will and resources for investment in international development, we confront the combined impact of “aid fatigue,” the protracted debt crisis, and its influence on capital flows. The multilateral financial institutions are not contributing significant net resources. For the remainder of this decade, the prospects for direct private investment in developing countries are not very encouraging — with a few notable exceptions. The combined effects of these factors suggest that, compared with the past three decades, the outlook for development finance is bleak. Whether via concessional or nonconcessional channels, resources available for investment in developing countries during the 1990s may even diminish in real terms and, perhaps, in nominal per-capita terms.
• **Technology Flourishes**

While technological advances open up new opportunities for some countries, they will likely create deeper and more intractable problems for others. In a brief span of two decades, and at an ever accelerating pace, we have witnessed the emergence of entirely new technologies in areas such as biotechnology, microelectronics, and new materials. Many of these new technologies are highly flexible and mobile, allowing for rapid and continuous modifications and improvements. As such, they are fast changing the way in which the international marketplace has functioned since 1945. Individuals, groups, and nations actively participating in the generation and exchange of these new technologies will prosper in the emerging new order; those left behind will become increasingly marginalized. The risk of marginalization is particularly severe for the least developed countries.

• **Global Cultural Transformation**

Cultural and environmental changes influence our thinking about development. Witness the growing importance of religious values, ethnic allegiances, and the rise of fundamentalism. In several parts of the world, these phenomena constitute the predominant influence on the lives of people and communities. They are often complicated when the wish to preserve cultural identity comes into conflict with the tendency of the mass media to promote a “foreign” culture.

• **Scientists in the South**

Over the past two decades, donor funding of research for development has increased very significantly, as has the number of agencies involved in such funding. The total amount of external support for research in developing countries has grown many times over and is now estimated at US $2 billion.
The number of international and regional research centres in the South increased from 140 in 1970 to more than 200 by 1990. In developing countries there has been a notable increase in the capacity to undertake research at the national level. For example, in the 20 years from 1965 to 1985, the number of agricultural researchers in the Third World increased fourfold to 45,000. Not surprisingly, some of the most impressive results of research have been in the areas of plant breeding and agricultural production.

The nature of research and how it is conducted have been significantly altered, partly by the products of research itself. New technologies, particularly in the communications and informatics fields, now offer tremendous potential for increasing the speed and efficiency of scientific enquiry. However, perceptions and beliefs about how research should be carried out to be more effective have probably changed more than actual practice. There is still much work to be done, including research on that very question.

**Implications for the Future**

The changes of the past 20 years have been dramatic, and the pace of change continues to accelerate. What, then, are the implications of this radically different context for the development process, for developing countries, and for development agencies like IDRC?

The first implication is the need to rethink what we mean by “development.” The underlying notion that development is a linear process is no longer valid. More and more, the term empowerment captures the essence of what “development” should be. Given that it cannot and should not be imposed upon a society from outside, development should mean above all giving people the power, that is, adequate knowledge and capacity, to decide what is best for them, and to act accordingly in fulfilling their own destinies.
The second implication is that generation, dissemination, and application of knowledge will become even more important in the development process. Perhaps the most vital difference between developed and developing, rich and poor, is the knowledge gap — the capacity to generate, acquire, disseminate, and use scientific and technological knowledge. This capacity will make the difference between the parts of the world where people are able to decide and act independently and those where they cannot.

A third implication is the need for fresh thinking about social, economic, and political institutions. Practical and effective intervention through the application of knowledge requires analysis of greater subtlety than that which is based on simplistic distinctions between “market” and “planned” economies, or “private” versus “public” spheres of economic activity. The ideologies that have supported these concepts have outlived their usefulness. Other types of interactions will be needed with a wider variety of entities — trade unions, professional associations, community organizations — that represent civil society and that are in the business of producing and using knowledge.

Fourth, we will need to redefine the role of the multilateral and bilateral development assistance agencies. The system was established to fit the conventional wisdom of “underdeveloped versus developed”, “market versus planned.” Even in 1969, before IDRC was created, the Pearson Commission pointed to considerable uncertainty about the roles of individual international organizations.... [There is] not yet an adequate framework for an expanded and intensified effort to put international development on a firm basis, render it more efficient and make it a cohesive force for international community. (Partners in Development, Report of the Commission on International Development, pp. 208, 227)
As a small but key player, born out of that realization, IDRC must help identify new ways by which development agencies can better coordinate their efforts.

It is time for all members of the international development community to marshall conceptual, methodological, and technological developments in the theory and practice of social, economic, and political change, putting them at the service of development efforts. New concepts of strategy formulation and implementation — for example, multidisciplinary, multi-sectoral approaches; interactive planning; strategic issues management — can contribute to better understanding and management of the problems of the 1990s. Progress in telecommunications, micro-electronics, and modelling tools makes it easier to acquire and exchange information, to experiment with the impact of alternative policies and decisions, and to disseminate ideas and communicate with the public at large. This progress is supported by a growing public awareness of global interdependencies and widespread social mobilization, often supported by mass media, around issues such as the environment, hunger, the arms race, governance, terrorism, education, drugs, and AIDS.

**Comparative Advantage of IDRC**

In this new context, the Centre faces a range of strategic choices. IDRC’s resources are finite — indeed they are minuscule in relation to demand, and even in relation to the resources at the disposal of many other agencies. We must ask ourselves, therefore, what comparative advantage the Centre brings to bear on the challenges of development in the 1990s. IDRC has a number of structural and policy-derived characteristics, as well as features it has acquired over two decades of existence, that confer certain advantages in its relations with the researchers it supports and with other development assistance agencies.
**Structure**

- IDRC was the first development assistance institution to focus exclusively on research support and on the development of science and technology capacity in developing countries. As such, it has a long and rich experience in this specialized field.

- IDRC has an international Board of Governors that confers broad legitimacy on its activities, differentiating it from purely bilateral agencies. At the same time, the fact that resources from IDRC come primarily from a single source has simplified budgetary negotiations and administrative requirements.

- IDRC is based on the explicit philosophy of a full intellectual partnership with its recipients in developing countries. Plans and priorities are defined jointly, with most research carried out exclusively by the recipients. The Centre has always been prepared to accept mistakes and occasional failures as part of the learning process that leads to capacity building. Thus, the Centre has avoided the pitfalls of traditional technical assistance agencies, and has pioneered an approach that encourages the exercise of judgement and authority.

- IDRC has developed a global perspective to mobilize science and technology for development objectives, building bridges across continents and putting developing-country researchers and policymakers in contact with each other. At the same time, it has given a regional flavour to much of its activity, responding to specific concerns and priorities. A main strength, however, (considering the Centre's limited funding capacity) lies in identifying commonalities in development problems and solutions, fostering comparative research across regions, countries, and cultures, thereby allowing widely different developing countries to learn from each other.
• IDRC is a **flexible, agile, mid-sized organization** with enough financial resources to make a difference in research and science and technology support. The Centre’s resources can be quickly redeployed because of the independence of its Board of Governors and freedom from many administrative and political constraints that affect other development agencies. It has combined support for policy research and for devising specific technical solutions to development problems, showing how knowledge and its proper application can make a difference in development.

**Reputation**

• IDRC has acquired a **favourable reputation and considerable prestige** in most parts of the developing world. This constitutes a tangible asset on which the Centre can build. To do so, however, will require innovation; the preservation of goodwill and a favourable image will require adjustments in the Centre to deal adequately with the new international context.

• IDRC has developed a **broad network of institutional and individual contacts** throughout the world. Thus, it may be uniquely placed to undertake new initiatives that can make a difference, by mobilizing a large number of organizations and people across continents and regions.

• IDRC has developed **considerable convening power**, based on the confidence it has built over several years of operation according to the principles, features, and characteristics described above. Once again, however, it needs to renew this resource continuously by demonstrating that it can continue to be innovative and exercise leadership.

These characteristics related to structure, policy, and reputation are the starting points to guide strategic thinking in IDRC in the coming years.
**Resources**

The financial resources available from the global community for international development efforts are limited, and are unlikely to increase in real terms for some years. There are severe and increasing pressures on fiscal systems everywhere. As a result, the flexibility to respond to domestic and external priorities is constrained. Canada and IDRC are not insulated from the global situation. In recent years, IDRC’s revenues have declined in real terms. While we must take all possible steps to reverse that trend, it would be unwise to assume that the parliamentary grant to the Centre will increase.

**The Imperative for Change**

The new context for development, the need to redefine our special role to remain effective, and the pressures of budgetary limitations — all these factors combine to make change in IDRC imperative. IDRC must define its future by carefully selecting program areas, concentrating energies and resources, and persevering in the chosen areas of work. This concentration and perseverance does not exclude the need for flexibility to respond well to changing circumstances. We must increase and improve our communication with Canadians so that they better understand the role, accomplishments, and potential of IDRC.

As changes are made — some rapidly, some phased in more gradually — we must take great care to keep our sights fixed on basic criteria and practices that will improve the Centre’s effectiveness. Some of these fundamentals for change have served us well in the past; others are necessary adjustments to the way in which we will pursue our mission.
A Blueprint for Change

Perspectives

How does IDRC see its role today? What are the qualities by which we wish to be known and judged?

The structural, organizational, and cultural characteristics of IDRC have evolved considerably over two decades. Our mandate requires that we constantly build and rebuild an organization that provides the necessary structure for recipients and staff at all levels to take responsibility, to innovate, experiment, and learn, thereby developing a far greater range of their capacities. The high degree of scientific specialization engendered by the knowledge explosion means that the Centre must develop mechanisms for drawing the appropriate specialized expertise into its endeavours.

The culture of IDRC must continue to be that of an organization for learning. This requires that we reaffirm and extend the entrepreneurial nature of our organization and its staff, that we seek ways to reinforce and reward experimentation and risk-taking in the context of a shared culture.

To consolidate and advance these characteristics of organizational culture, our basic operating style must be built on certain basic principles:

- delegating to staff and recipients as much authority as possible within a context of agreed objectives;
- minimizing the levels of approval to encourage more initiative
- demanding accountability; and
- learning from the past to improve performance in future.

Such an operating style calls for delegation of decision-making processes and learning. The intent must be clearly to develop the capacities of people, give them greater opportunities to contribute,
and integrate their contributions within a learning process that is cumulative and whose results are greater than the sum of its parts. It is important, therefore, that we pass to our research partners even greater responsibility and authority in defining, planning, executing, and controlling the research agenda. This will entail the acceptance of higher risk, but it is imperative to the evolution of responsible partnerships and genuine empowerment.

A related requirement is a willingness to embrace error, and an understanding that mistakes are an inevitable part of any learning process — all the more so in the domain of research. If we do not consciously take risks and embrace the learning value of our mistakes, our ability to innovate and be at the leading edge of research for development will be compromised.

Where should IDRC situate itself to profit to the fullest extent from our strengths and to maximize our contribution to international development? Our relevance and impact will be greater when we make full use of our comparative advantage.

Strategic initiatives will be needed that combine specific program choices with innovations in the way we conduct both our internal business and our relations with our research partners. Such initiatives may typically involve

- strengthening national research capability to create core centres of excellence that can be linked to programs in other countries as well as in the home country;

- international initiatives, such as serving as a catalyst in the creation of international research or information centres to support disparate national efforts — such initiatives might also involve other actors, including both government and private sectors; and

- alliances with other funding and development agencies to create multilateral financial and policy frameworks.
One example of previous Centre experience with this kind of initiative is a project to explore the potential development benefits of agroforestry. The potential of combining agricultural and forestry practices for the creation of sustainable agricultural production systems was not unknown, but until the IDRC initiative there was only limited research in a few small programs. On the basis of a review of agroforestry commissioned by IDRC in 1975, a group of international donors decided to create the International Council for Research on Agroforestry (ICRAF), with IDRC serving as executing agency. ICRAF has recently been accepted into the Consultative Group for International Agricultural Research (CGIAR), a global network of 16 research centres, which assures financial stability and the ability to respond to the growing concern for environmental sustainability.

There have been many other successful initiatives, such as the development and dissemination of the MINISIS bibliographic software system, which has greatly assisted developing countries to enhance information systems and has been a modest commercial success in the industrialized world. Others include a macroeconomics network in Africa, the International Commission on Health Research for Development, and an economic mission to South Africa at the request of the Canadian government. These activities differ widely, yet they are all based on identifying a major niche where the Centre can make a significant contribution and pursue a strategy involving other actors over a considerable period of time. These examples serve to illustrate the range of strategic initiatives led by the Centre. They have made a difference by exploiting our comparative advantage.

**Directions**

Given the need to develop strategic niches and to become a more "results-oriented" institution, the following general directions will guide our program choices: working on global problems; using research capacity more effectively; working with others; and acting as a knowledge broker.
Working on Global Problems

IDRC's contribution in the past has tended to focus on issues that profoundly affect the quality of life and which are regional or local in character. The Centre will continue to support such research; however, with increased national capacity in developing countries to address more sector-specific and location-specific research questions, and with other donors providing more resources, we believe it would be better to devote relatively more resources to a few, carefully selected global and interregional problems. Such problems will require greater emphasis on interdisciplinary approaches.

The development prospects of individual countries are determined by changing trade patterns, financial markets, demographics, and environmental conditions. Yet, research to understand their effects and identify different options is often inadequate. Lack of knowledge about options, opportunities, and potential pitfalls is one of the main reasons why developing countries have only limited influence on the global agenda. This is particularly true in science and technology where rapid change and new discoveries are a constant. The Centre proposes to direct more support to those areas where the research is likely to effect change and increase participation by the developing world.

Using Research Capacity More Effectively

While there has been an increased in research capacity in developing countries over the past twenty years, the available resources are still grossly inadequate when compared to demand, and this situation is not likely to improve in the foreseeable future. On the other hand, there could be significant short-term gains from increases in productivity, given the size of the resources available to existing research systems in the South — currently estimated to be about US $20 billion, as measured by the total annual expenditure on research and development of all types.
The problem for development research is not only to attract more funds (although this is important) but also to ensure that existing capacity is used effectively. IDRC will contribute to the effective use of research capacity in two ways: greater commitment to utilization, and better understanding of "what works" in development research.

- **IDRC and utilization:** IDRC will make greater efforts and commit more resources to ensure that the products from the activities which it supports are used — through better specification of the expected outcomes and clearer identification of potential users, uses, benefits, and costs. Intended beneficiaries will take a more active part: they will determine what research is required and, if appropriate, will decide on the research process itself. IDRC will be more active in funding or seeking resources for follow-up activities such as testing, the construction of pilot plants, and dissemination.

To take research and knowledge to the stages of application and utilization may require joint actions and partnership with private enterprise. Efforts will be made to involve the private sector where appropriate. This is a relatively new area for IDRC, one that will cut across all Centre programs and will doubtless pose new challenges.

- **Research on effective research systems:** The Centre will intensify its efforts to assess "what works" in development research. Little information exists on how research for development is best organized or how to ensure that the products of useful research can be more speedily and widely applied. A new program will be developed to support research on such topics. It will draw on the accumulated experience of the Centre's own evaluation program. The new program will pay particular attention to the important question of how to improve policy research — the formulation, packaging, and application of knowledge for policy-making.
**Working With Others**

The Centre will work more closely with others to enhance both the financial resources for necessary research and its overall influence on development issues. To be more effective and relevant, it is necessary for IDRC to be engaged actively with a larger number of actors — including Canadian universities and the scientific community, multilateral institutions, other donors, and, above all, our partners in developing countries.

While IDRC will be more active in identifying issues to be addressed, the principle of mutual respect will continue to guide our choices. Advisory groups and other consultative mechanisms will allow the Centre to work even more closely with developing-country researchers and policymakers. IDRC will seek new approaches for this partnership including more responsibility to appropriate institutions and researchers in the South.

Support for South–South collaboration will continue to be a key feature of Centre operations. IDRC will test new communication techniques to increase the international sharing of knowledge among countries and improve existing networks.

Enhanced partnerships with Canadian organizations and institutions will also be developed. The Centre's involvement with Canadian organizations has been relatively limited, with the notable exception of the Cooperative Program, initiated in 1980. The Canadian development community, always small, is in decline and Canadians have fewer opportunities to participate directly in development work. In this regard, the complementary natures of IDRC and CIDA, the Canadian International Development Agency, suggest a continuation of recent efforts to exploit a special partnership. Involvement with other Canadian institutions should look beyond the traditional concept of North–South technical assistance, and should focus on the mutual interests of Canada and developing countries.
The Centre already has close links with the small groups of agencies and foundations that devote most of their resources to supporting development research. The Centre intends to reinforce and expand linkages to these and other development-financing organizations. The larger donor agencies, for whom research is only a small part of their lending programs, contribute most of the funds that are labelled "development research." They are potentially key actors in implementing research results. IDRC will explore a broader relationship with these larger agencies, such as the World Bank, the regional development banks, and UNDP.

IDRC must seek out new partnerships in development with non-Canadian organizations. This will include co-financing large-scale projects and programs. The Centre will need to identify those areas which other donor agencies (whether multilateral, public or private) place special emphasis.

**Acting as a Knowledge Broker**

Over and above providing funds to research, IDRC plays a role as a knowledge broker. Its widespread access to a broad network of Canadian and developing-country researchers, and to information on development and on science and technology, means that it has a responsibility to inform and influence others, both in developing countries and in other development organizations. At the micro or project level, the Centre can provide information to researchers, and put them in contact with the scientific community at large.

Learning what works and why, will permit the Centre to build on its existing capability as a learning organization. The knowledge gained from evaluation of project and program results will be used to inform and influence other actors. IDRC will improve its scanning of the research environment and its ability to pick out important but neglected areas.
Guiding Principles

Sharpening The Focus

To have a significant impact, programs must have a critical mass of resources. Recognizing the need for an integrated and coherent set of research activities, the Centre will concentrate its resources in fewer programs. IDRC will continue to promote and experiment with more integrated approaches that cut across disciplines. The smaller number of program areas and increased attention to global and interregional development issues will ensure that the disciplinary and interdisciplinary aspects of problem-solving are addressed in context and not in isolation.

The structure of IDRC has been streamlined. As our program agenda focuses increasingly on global and interregional problems of development, more emphasis will be placed on interdisciplinary and interdivisional approaches to research and problem solving. The revised organizational structure of the Centre has been designed to facilitate the following:

- through consolidation, the number of program divisions has been reduced from seven to five;
- common or Centre-wide activities (which were subject to some overlap and duplication) have been combined and given more clearly defined responsibility and accountability; and
- the number of management levels has been reduced to three, including the President.

These changes not only encourage a more cooperative and interdisciplinary approach to Centre activities, but are also designed to make IDRC a more flexible institution and encourage staff to take initiatives and test new ideas.

As part of the restructuring process, the roles of the program divisions have been redefined. In summary, the responsibilities of the new divisions are as follows:
• The **Environment and Natural Resources** division supports technical and policy research into the sustainable utilization of natural resources in the broadest sense. This encompasses strategic, applied, and adaptive research on the transformation and marketing of natural resource products, as well as environmental research and the promotion of integrated, participatory approaches to research in these fields.

• The **Social Sciences** division is organized to support two lines of research: economic, trade, and technology policy research including areas such as macroeconomic adjustment and social services financing; and applied social policy research focusing on the conditions, planning, implementation, management, and outcomes of social policy processes in relation to strategies for human development.

• The **Health Sciences** division promotes a three-pronged, integrated approach to health research that focuses on people. The emphasis is on identifying health risks in the living and working environment; on understanding the effects of local knowledge, circumstances, and behaviour on health; and on enhancing the effectiveness, efficiency, and sustainability of health systems and services.

• The **Information Sciences and Systems** division aims, through research and the design and establishment of appropriate information–communication systems, to improve the flow and use of scientific, technical, and other information. Promotion of the use of modern information tools and methods, as well as the continued development of the MINISIS database management software, are also part of the program.

• The **Corporate Affairs and Initiatives** division covers those nonadministrative initiatives that are of Centre-wide significance. These include the development of effective research systems; the provision of information about developmental research; the encouragement of initiatives
that involve Canadian institutions, individuals, and communities in the Centre's work; and policy research and analysis.

- The Finance and Administration division is responsible for all administrative functions across the Centre including finance, human resources, management information services, and general administration.

With the new strategy, the average size of IDRC grants is expected to rise. The Centre will focus on a smaller number of institutions, but its support to research projects will be more complete — meeting such needs as library services, administration, and training, as well as research itself. This is an area in which the Centre has considerable experience, particularly through its experiments with integrated support for research institutions. The Centre will select the most appropriate institutions to work with and, where possible, ensure necessary linkages through networking and spillover to other countries ready to engage in similar research activities. Concentration on a smaller number of institutions is likely to lead to the Centre working in fewer countries.

IDRC's network of overseas offices was established to respond effectively to local needs. The definition of roles and responsibilities between headquarters and regional offices does not, however, provide the clarity required for efficient and effective resource allocation. Additionally, the Centre is simply not in the position to build the full range of programs in each regional office. Moreover, as the Centre moves increasingly over the next few years to work on global and interregional problems, we must determine the extent to which the regional offices are the most appropriate vehicles.

To resolve these issues, the IDRC regional offices will be designated as responsibility centres for region-specific programs. Their responsibilities will include planning, execution, and evaluation. The first step will be the preparation of regional strategic proposals that will be drawn up under the authority of the head of each regional office. The analysis will include a framework
of regional development concerns, the research environment, including the activities of other donors, and proposals involving research priorities and partner institutions.

**Perseverance**

Building strong research institutions and strengthening their capacity to conduct research and utilize research results is a time-consuming process that requires persistence. Future IDRC support will be sustained for longer periods. Support to short-term projects in isolation from the broader institutional development context, has proven to be relatively ineffective, particularly in weaker research institutions.

**An Efficient IDRC**

In carrying out its mission, the Centre must become more efficient in the use of resources.

To become more efficient, we must reinforce the importance of full intellectual partnership in the support of research. In addition to financial support, the Centre will continue to provide non-administrative support and other kinds of services. Therefore, we will continue to appear "labour intensive" relative to some other agencies.

The Board, at an Executive Committee meeting in June 1991, clearly indicated that first priority should be given to increasing the "proportion of the Centre’s funds flowing in direct support of research in developing countries." The proportion of total funds that flows out to grant recipients is one indicator of efficiency that has declined in recent years, a trend that now must be reversed. The intention is to increase this percentage steadily over the next several years to a level of approximately 70 percent.

There will be fewer staff in IDRC. The transition will be phased over a period of 18 to 24 months. There are several reasons for this. The Centre has a very large "investment portfolio" of active research projects. In moving to a new structure and greater
program concentration, decisions about which projects to maintain and which to close should not be taken hastily. The latter will require technical and financial monitoring until our commitments have been met. This work is best done by those familiar with the institutions and procedures, both in Ottawa and the regional offices. Furthermore, the Centre wishes to effect the changes and the transition with sensitivity and full attention to the human dimension.

Administrative procedures must be streamlined and simplified to achieve greater efficiency and to permit a reallocation of financial resources from administrative to program activities. This must be effected with great care to ensure that the highest standards of administrative service are maintained, and that the fiduciary responsibilities of the Centre are not compromised.

Assessing the Centre's Performance

Like other research organizations, IDRC has a lot of information about research inputs. By contrast, the measurement of outputs is much more complex and difficult, and information is limited.

Research, by its very nature, entails a high level of risk and results may be apparent only over the very long term. Therefore, IDRC must reinforce its own knowledge of the assessment activities and results of other organizations. In addition, Centre programs and activities must become more precise in stating objectives in terms that are conducive to assessing and measuring output.

It will often be difficult to explain with absolute clarity the link between Centre activities and results judged useful to development. This should not prevent us from encouraging the measurement of development effects whenever possible, while making a clear distinction between inputs and outputs, and between intermediate results and ultimate impact. Emphasis on assessing what we do and what we achieve will help the Centre increase the efficiency and effectiveness of its operations, demonstrate quality and willingness to improve performance, and allow it to exert a positive influence on partners and recipients.
**Diversifying IDRC Funding**

As previously indicated, there is a low probability of any increase in real terms in the Centre’s parliamentary grant in the near future.

While we must adjust to short-term financial realities, we must do so in such a way as to attract new and more diversified sources of financing as soon as possible. The best way to do this is by maintaining and enhancing our effectiveness. The Centre will attempt to identify new resources for development research both from Canadian official development assistance (ODA) and external sources. There may be opportunities to use funds from other research-funding agencies and to generate revenue from publications, patents, and by contracting Centre services.

The Centre already has some experience in this area: over the years, approximately CA $42 million has been managed outside the parliamentary grant. This covers funds from external ODA agencies for specific projects and modest revenues derived from the sale of Centre patents and publications. However, the Centre has not as yet actively encouraged or searched for alternative sources of funding given the record of growth in its parliamentary grant.

We intend to contract out services or facilities wherever this can be accommodated within Centre objectives, and to test more innovative approaches in promoting the utilization of research. There may be opportunities for private sector funding of pilot development phases arising out of successful research work. These initiatives may best be handled separately from the grant-disbursing function and structure of the Centre. IDRC will study the feasibility of establishing an appropriate mechanism — for example, some form of private sector entity, such as a wholly owned foundation — that would be able to operate on commercial principles to increase revenue for IDRC.
Conclusion: Empowerment through Knowledge

We live in an era of change, more powerful and rapid than at any time in recorded history. The shape of our global order is changing in dramatic and irreversible ways — some say the very survival of the human species is threatened. Those who regard the situation with optimism, however, point to the enormous potential of planetary resources — physical, technological, and above all human — available to bring about increased well-being.

The optimists interpret recent events on the geopolitical front as evidence of the human will to remove totalitarianism and permit the emergence of participatory and pluralistic systems within which human creativity can flourish. Other analysts view the current situation with alarm — it is the human race, after all, that created most of the problems that now threaten to destroy it. There is broad agreement, however, on the urgency of directing global resources toward realizing the potential for human benefit that unquestionably exists. The point of balance is fine and the risks from a misdirection of those resources great. Thus, is it imperative that not only physical resources, but all our conceptual and methodological capabilities be marshalled in the interest of development.

To intervene effectively, IDRC will be guided by the focus of our mission: empowerment through knowledge. Resources alone are not sufficient. Our role must be to help provide that other necessary ingredient — knowledge, but in such a way that people are empowered by knowledge to determine and meet their own needs without damaging their neighbours' or their children's prospects of doing the same.

All the elements of our strategy — the choice of program areas, the delegation of research responsibilities to partner institutions, the participation of beneficiaries in the research process, the integration of scientific disciplines to exploit opportunities, the
tailoring of programs to fit specific regional characteristics — will be
directed toward empowering researchers, leaders, and citizens with
relevant knowledge.

The very act of implementing this strategy will generate
new ideas and will encounter shifting ground. Certain fixed points
and sustained effort will be needed. IDRC and its research partners
will need to remain conscious of the room to manoeuvre provided
by the strategy, of the obligation to exploit it to the fullest, and of
the imperative that the Centre’s characteristics of risk-taking
and perseverance be further developed and reinforced.

Preserving the ability to see the horizon as well as the immediate
foreground, distinguishing the optimum from the expedient, and
pursuing the difficult at the expense of the orthodox: these are the
foundations of this strategic plan and will be the hallmarks of a
Centre of excellence.
